Abstract. We prove the reverse ultra log-concavity of the Boros-Moll polynomials. We further establish an inequality which implies the log-concavity of the sequence \( \{i!d_i(m)\} \) for any \( m \geq 2 \), where \( d_i(m) \) are the coefficients of the Boros-Moll polynomials \( P_m(a) \). This inequality also leads to the fact that in the asymptotic sense, the Boros-Moll sequences are just on the borderline between ultra log-concavity and reverse ultra log-concavity. We propose two conjectures on the log-concavity and reverse ultra log-concavity of the sequence \( \{d_{i-1}(m)d_{i+1}(m)/d_i(m)^2\} \) for \( m \geq 2 \).
